

# Solar Technology

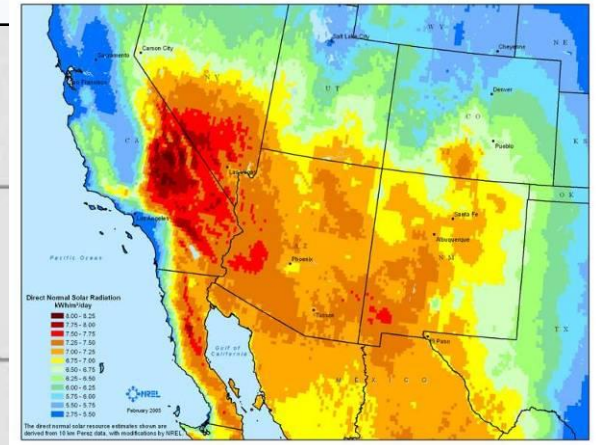

## BLM – Arizona Lands Training June 25, 2008

Doug Dahle, Sr. Program Manager  
National Renewable Energy Laboratory  
[www.nrel.gov/pv](http://www.nrel.gov/pv)

# Overview of Discussion

- Solar Resource GIS Analysis – Siting
- Concentrating Solar Power (CSP) Technologies
- CSP Development Issues
- Photovoltaics (PV) Technologies
- PV Development Issues
- Solar Market Factors
- BLM HQ Lands & Realty support
  - Funded NREL to provide Solar ROW POD review and consultation as requested
- Q&A throughout discussion

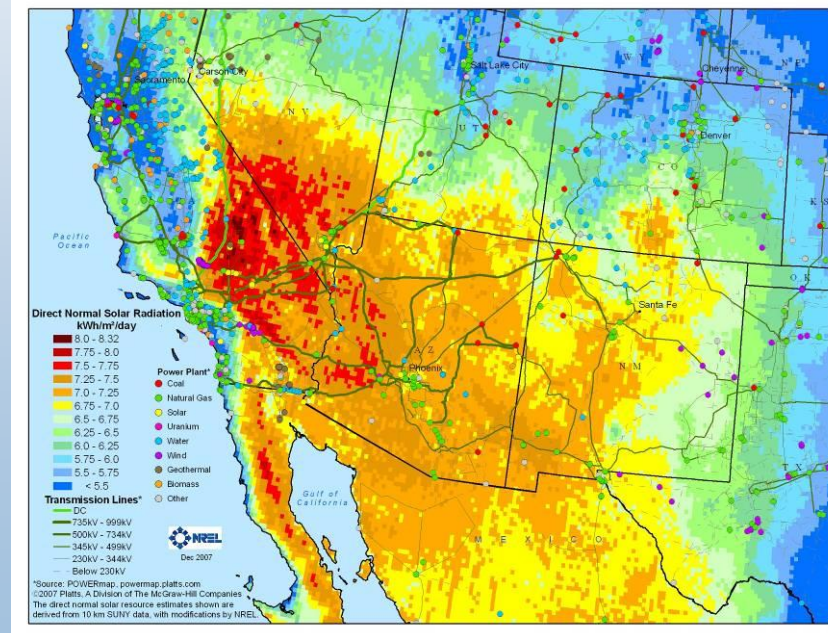

# Solar Resource Analysis Focused on the Southwest Region

# U.S. Southwest GIS Screening Analysis for CSP/PV Utility Scale Generation

## Screening Approach

- Initial GIS screening analysis used to identify regions most economically favorable to construction of large-scale CSP or PV systems.
- GIS analysis used in conjunction with transmission and market analysis to identify favorable regions in the southwest

# Solar Resource Screening Analysis

All Solar Resources

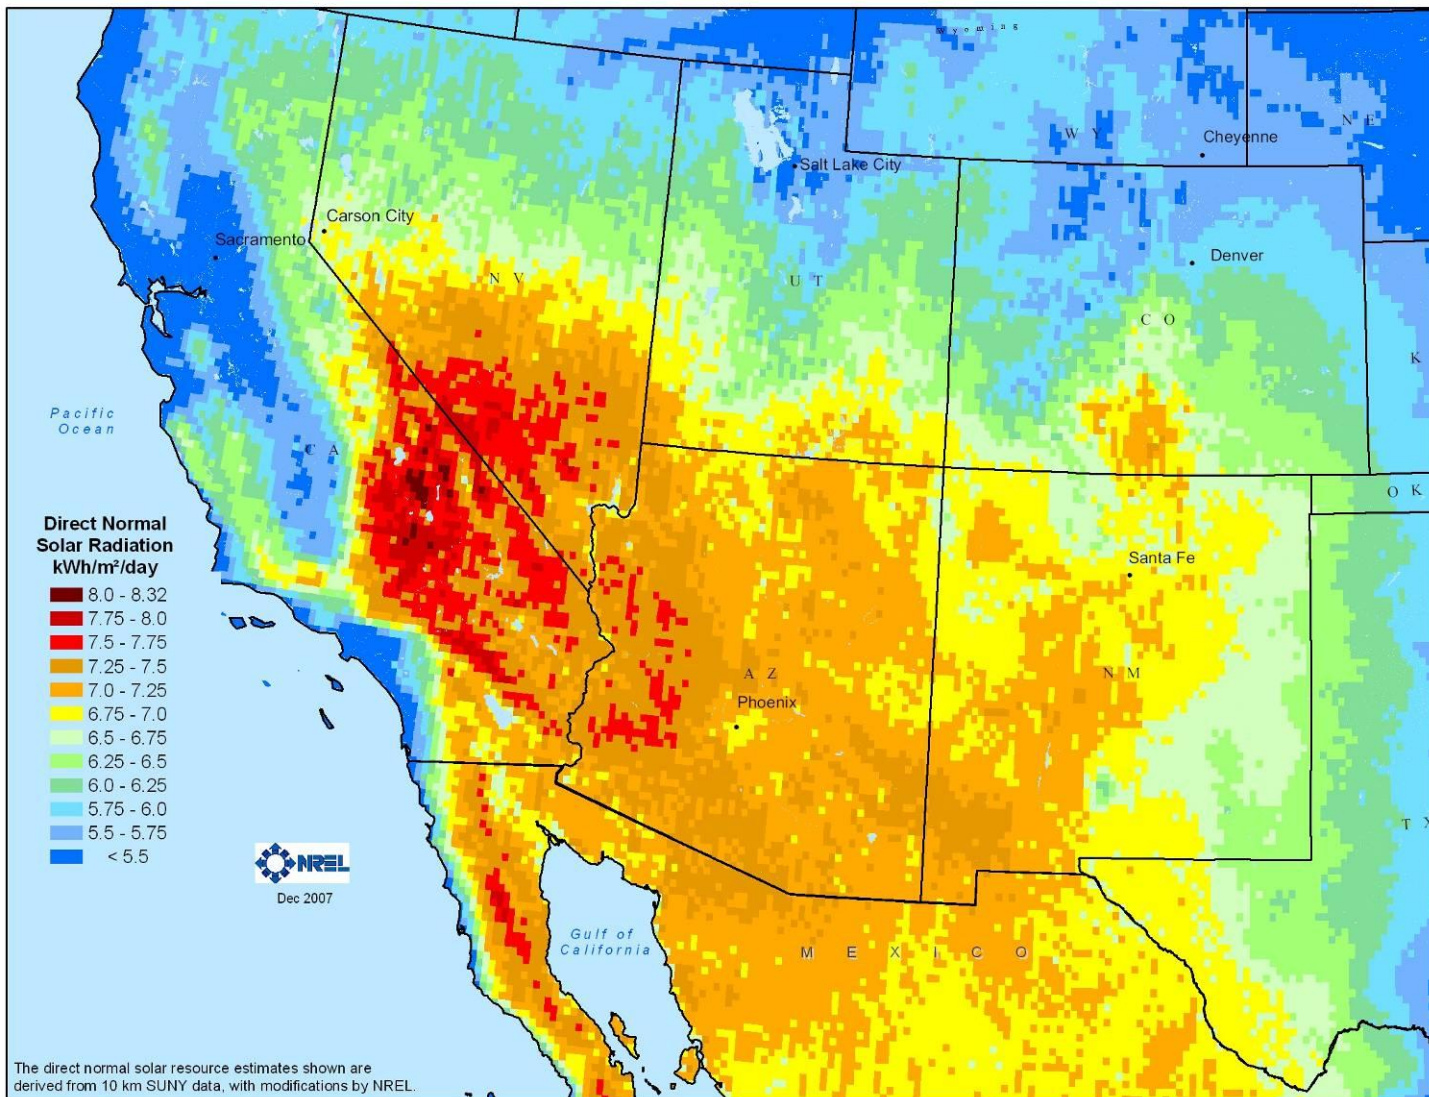

Locations Suitable for  
Development

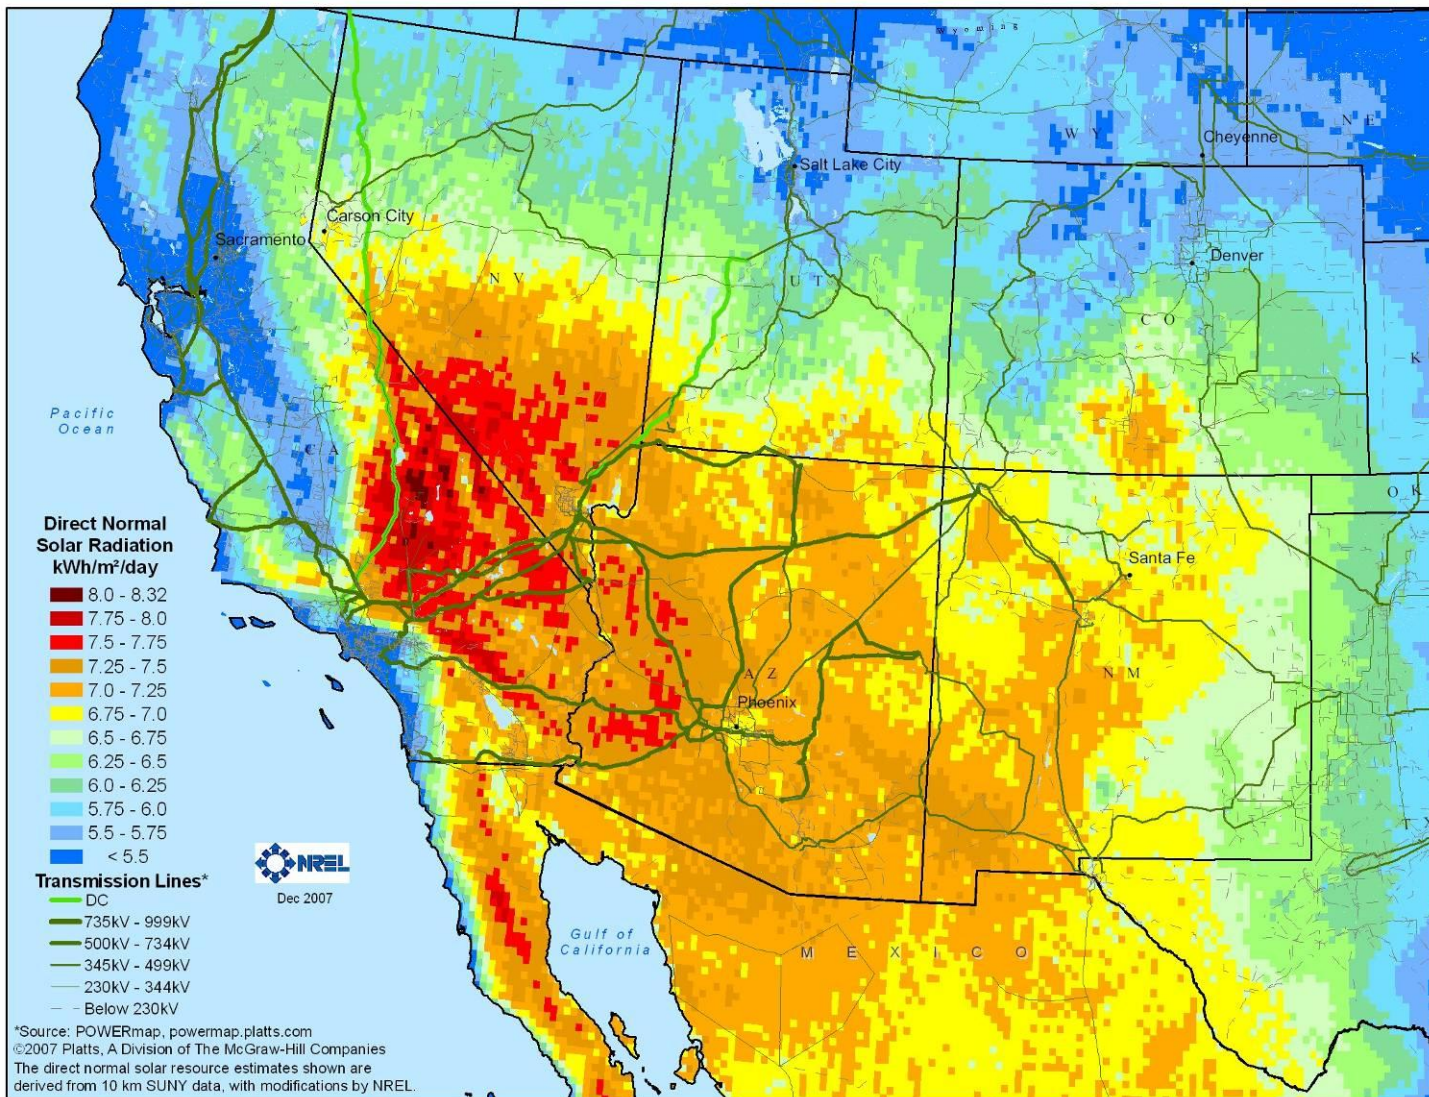

1. Start with direct normal solar resource estimates derived from 10 km satellite data.
2. Eliminate locations with less than 6.0 kWh/m<sup>2</sup>/day.
3. Exclude environmentally sensitive lands, major urban areas, and water features.
4. Remove land areas with greater than 1% (and 3%) average land slope.
5. Eliminate areas with a minimum contiguous area of less than 1 square kilometers.

# Southwest Solar Resources - Unfiltered Data

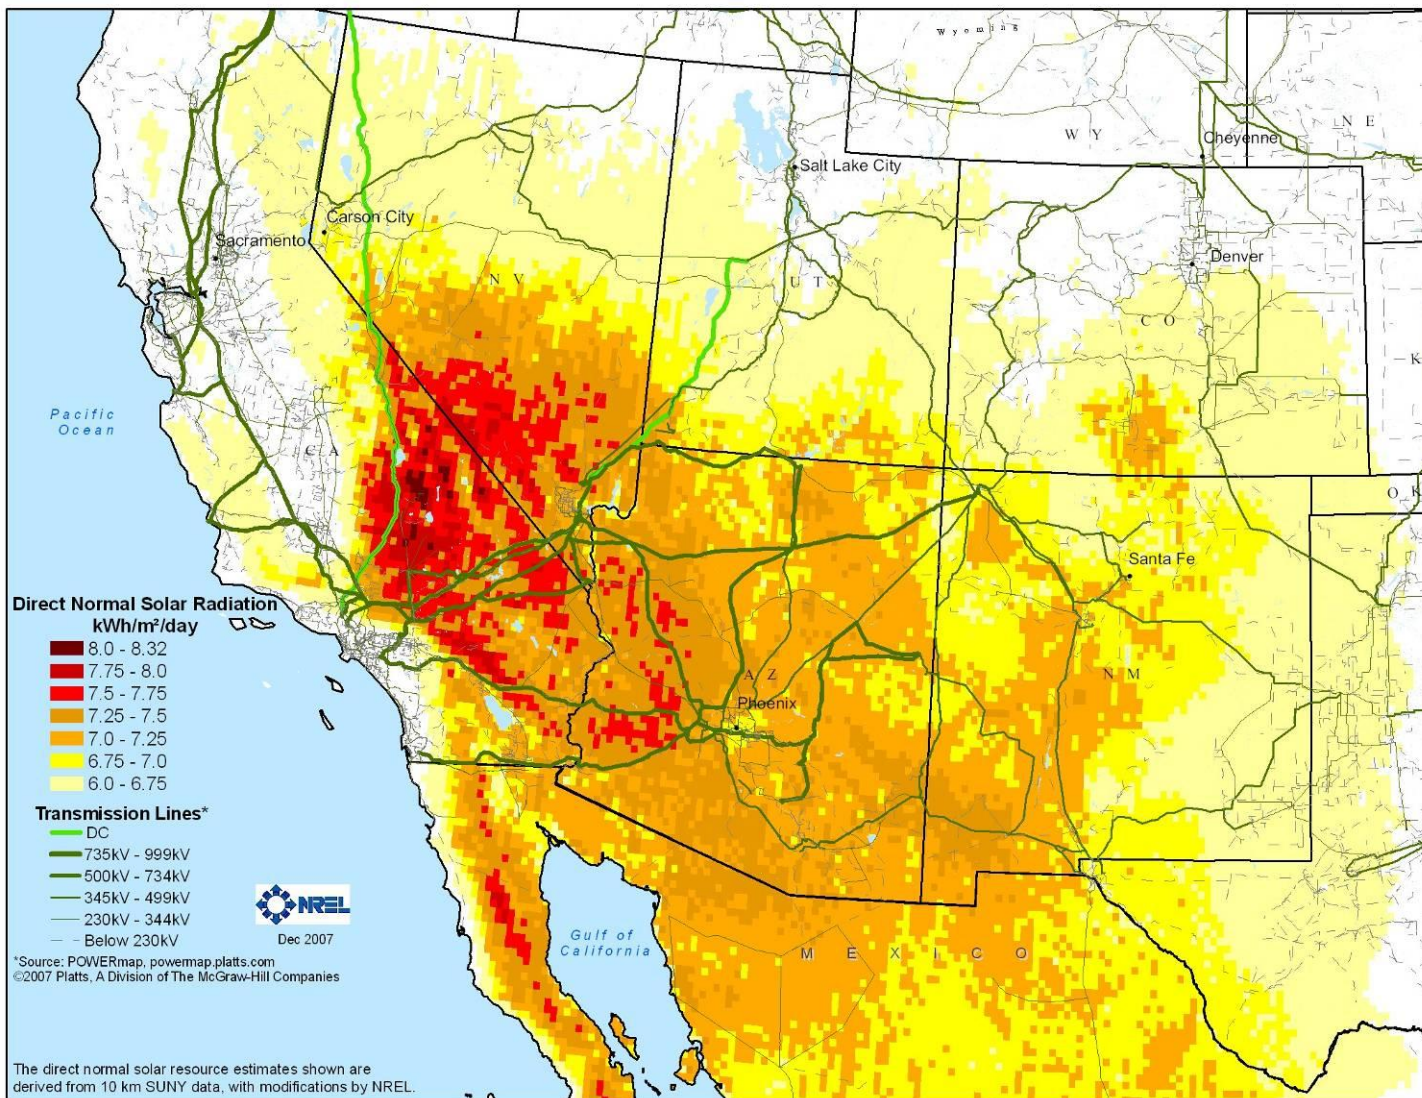

# Southwest Solar Resources – Transmission Overlay

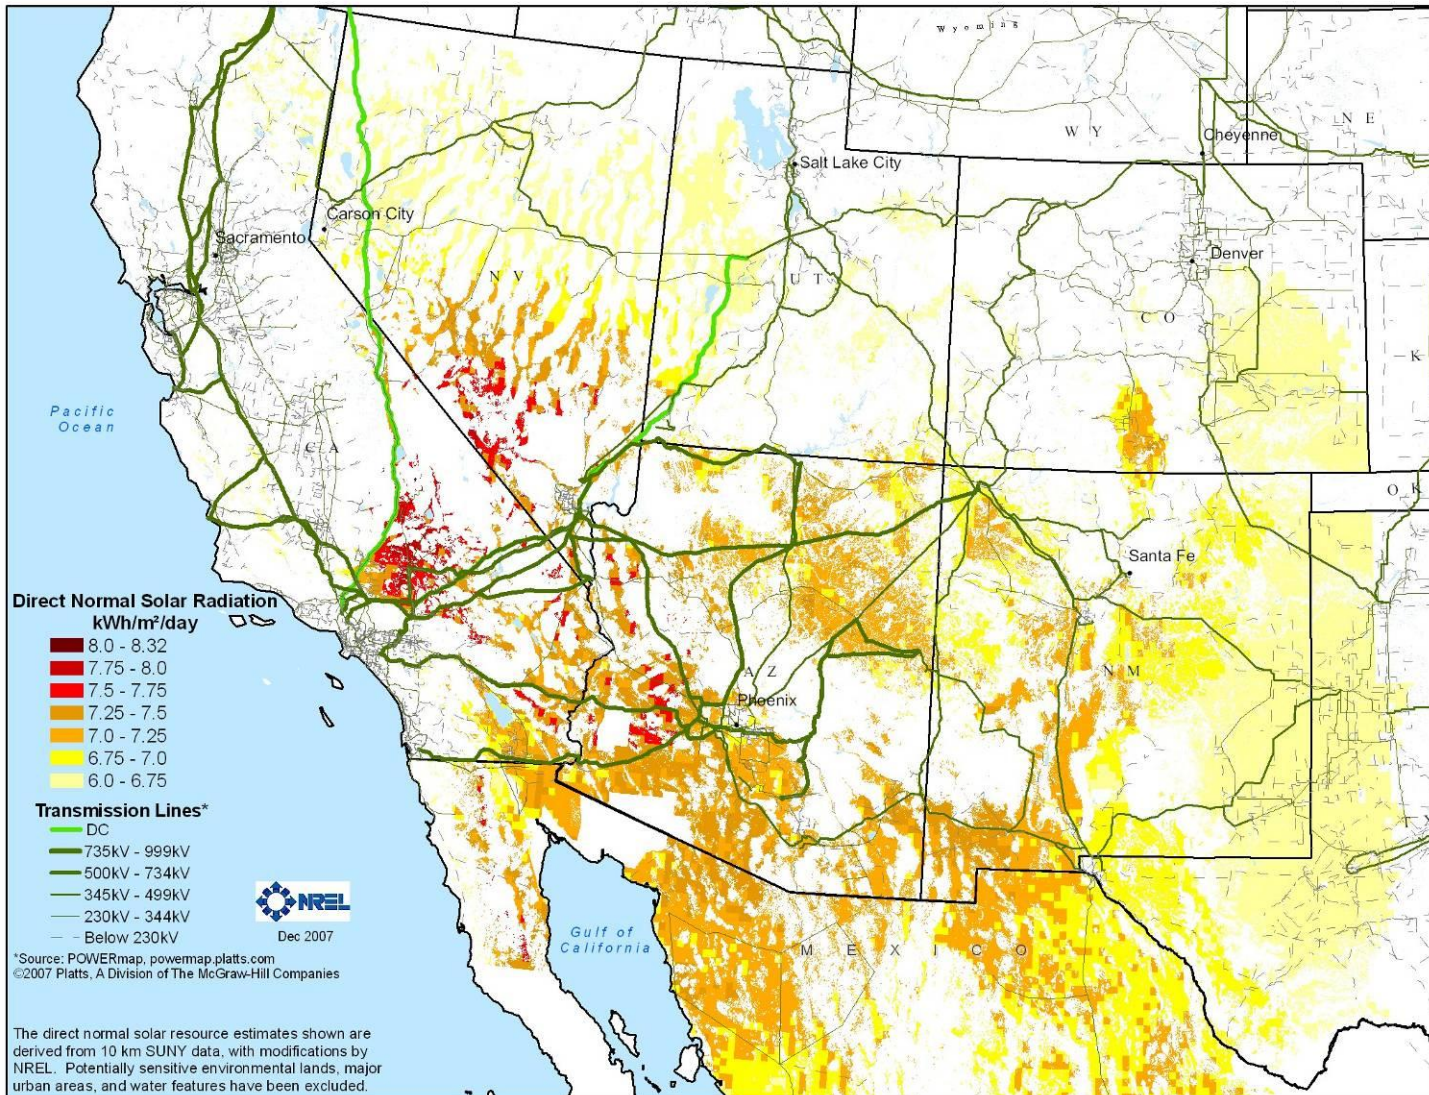

# Southwest Solar Resources > 6.0 kWh/m<sup>2</sup>/day

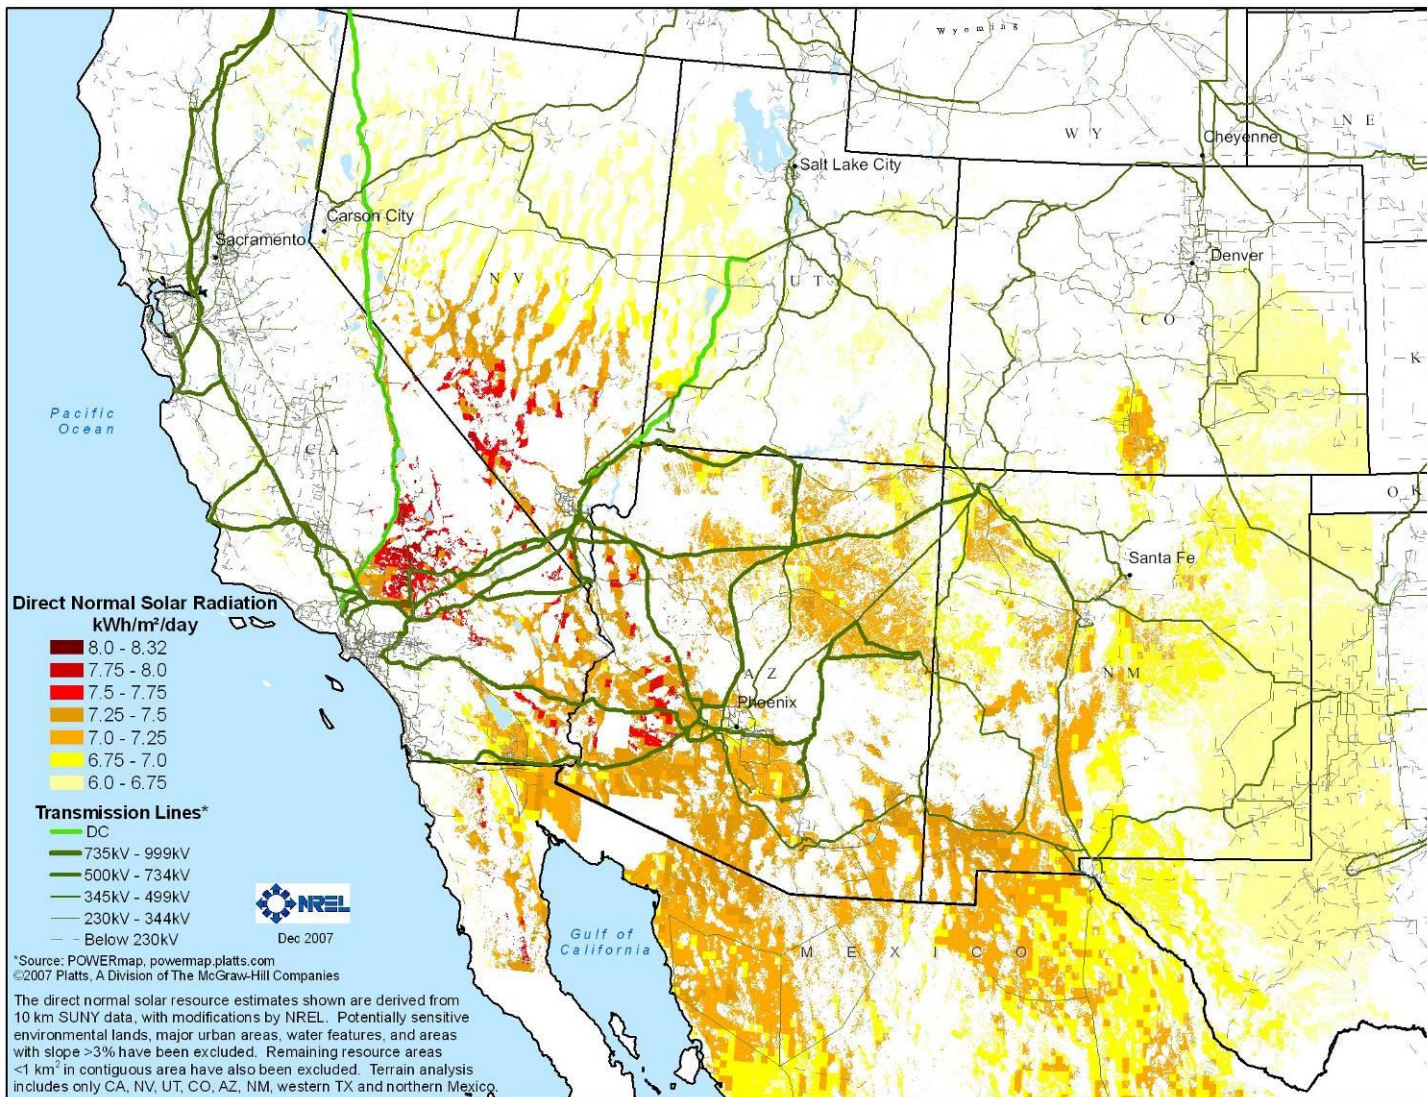

# Southwest Solar Resources with Environmental and Land Use Exclusions

# Southwest Solar Resources

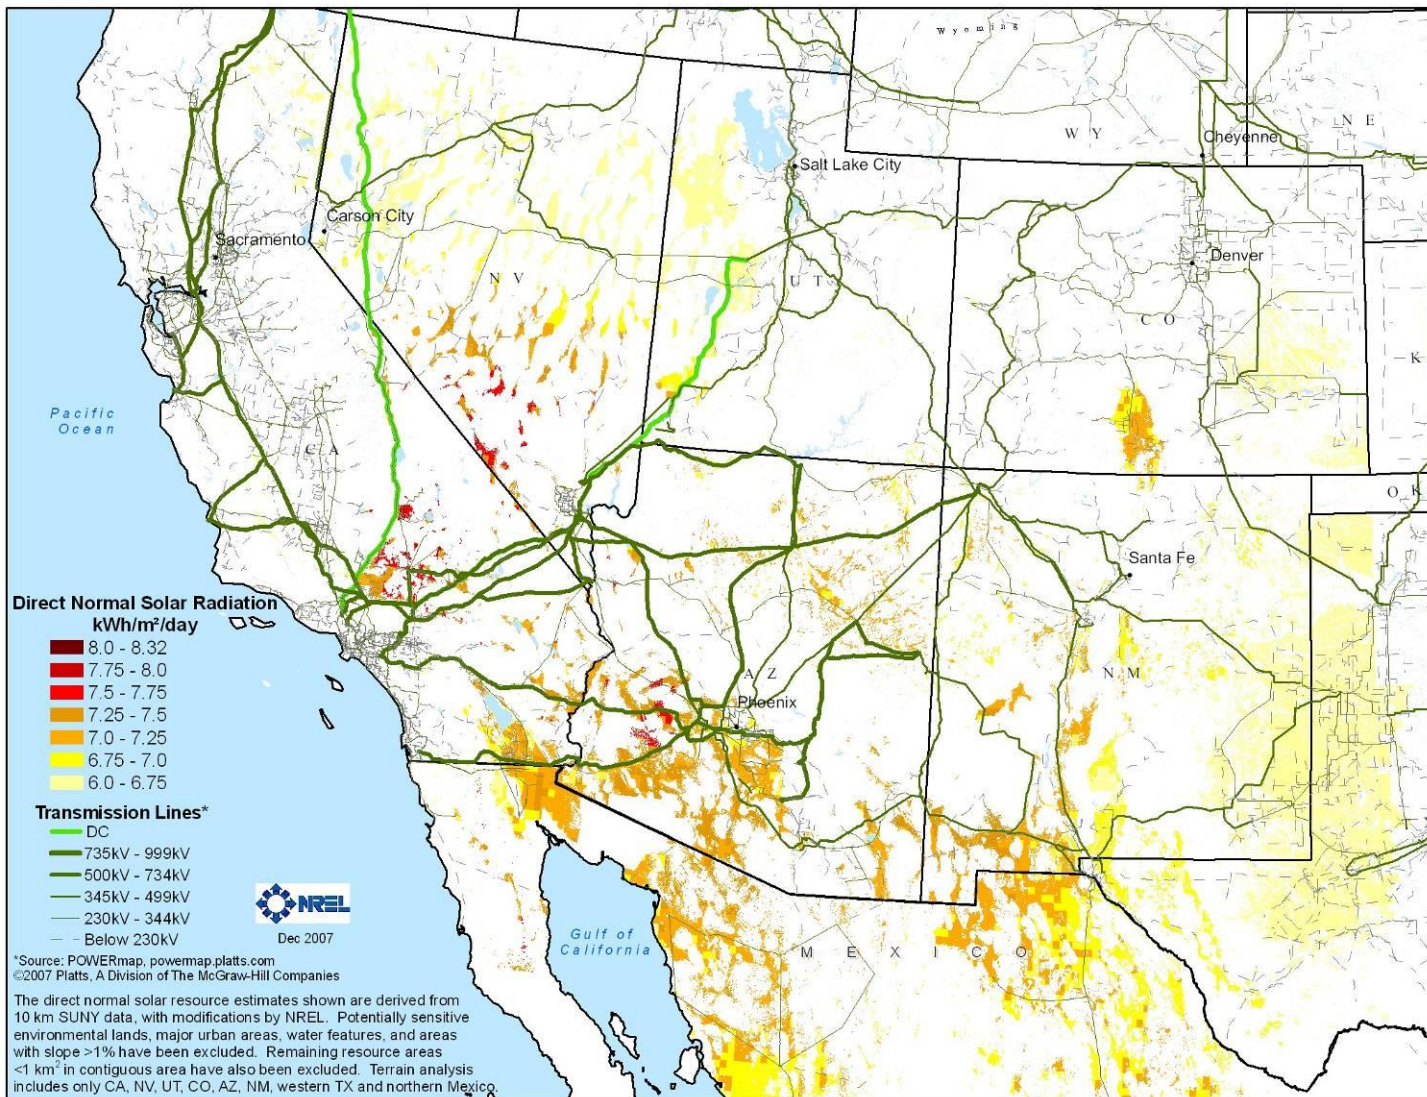

## Previous plus slope < 3%

# Southwest Solar Resources

## Previous plus slope < 1%

# CSP Technologies

- Parabolic Trough Linear Focusing Thermal Electric
- Linear Fresnel Reflector (LFR)
- Power Tower
- Dish-Stirling Engine

# CSP – Parabolic Trough

A parabolic trough is a solar concentrator that follows or tracks the sun around a single, rotational axis. Sunlight is reflected from parabolic-shaped mirrors and is concentrated many times onto the receiver tube at the focal point of the parabola. Synthetic heat transfer oil pumped through the receiver tube and is heated to approximately 752 F (400 C). The oil transports the heat from the solar field to the power block where the energy is converted to high-pressure steam in a series of heat exchangers. This steam is converted into electrical energy using a conventional steam turbine.

# Parabolic Trough Collectors

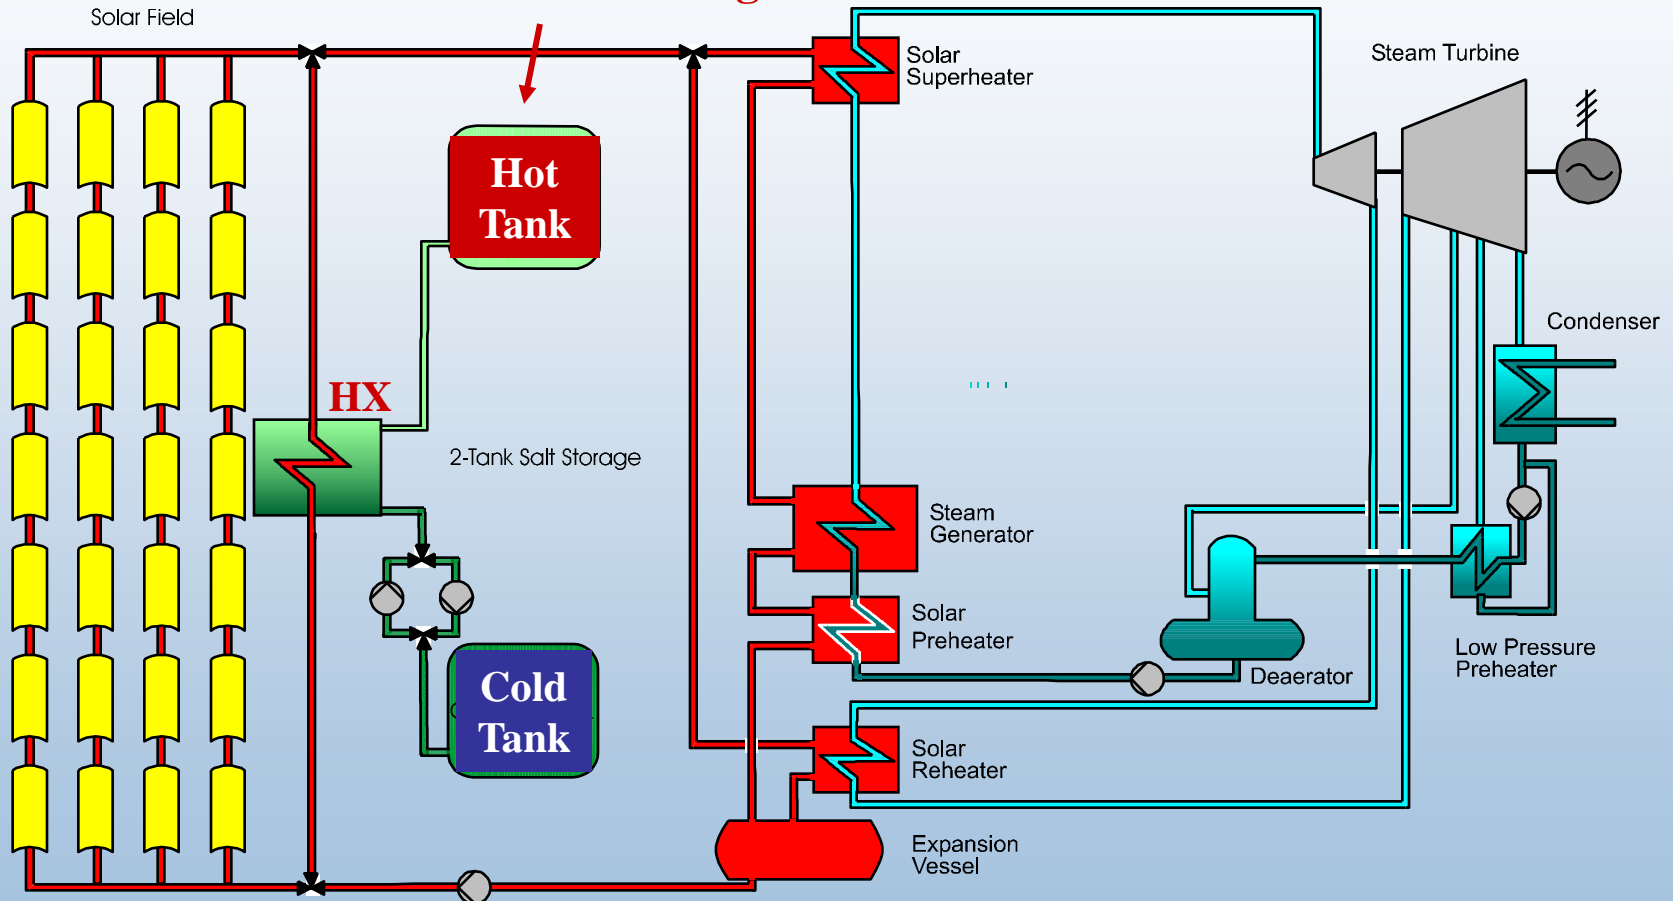

Perspective on Collector Size

# Parabolic Trough Power Plant with Thermal Storage

## 2-Tank Molten-Salt Thermal Storage

# High Value of Dispatchable Power Meeting Utility Power Demands

- Storage provides
  - **higher value** because power production can match utility needs
  - **lower costs** because storage is cheaper than incremental turbine costs

# CSP - Linear Fresnel Reflector

Simple flat moving reflectors follow the path of the sun and reflect solar heat on fixed receivers above. Concentrated sunlight boils water or other heat transfer fluid in fixed tubes to create high pressure steam to be stored or delivered to conventional steam turbines for power generation.

# Compact Linear Fresnel Reflector

View of CLFR Installed System

# CSP - Power Towers

Power Towers consist of an array of thousands of relatively small flat glass mirrors placed around the receiver (solar boiler) which converts the light received into useful heat. These mirrors reflect sunlight onto the collection surface of the solar boiler approximately 300 feet in the air on top of a tower. The concentrated sunlight focused on the collection surface is used to directly heat steam, which then drives a turbine/generator to produce electricity. Some Power Tower receivers use molten salt as heat transfer medium to generate steam through heat exchangers (like parabolic trough). Molten salt effective as thermal storage medium for dispatchable power

# Power Tower Systems

# CSP Dish-Stirling

The Dish-Stirling is a 25 kW solar power system that has been designed to automatically track the sun and focus solar heat onto a power conversion unit (PCU). This in turn converts the intense heat to grid-quality electricity. The concentrator consists of a 38-foot diameter dish structure that supports 82 curved glass mirror facets, each three feet by four-feet in area. These mirrors concentrate solar energy onto the heater head of a high efficiency, 4 cylinder reciprocating Stirling cycle engine, generating up to 25 kW of electricity per system.

# CSP Dish-Stirling

## View of Commercial Scale Installation

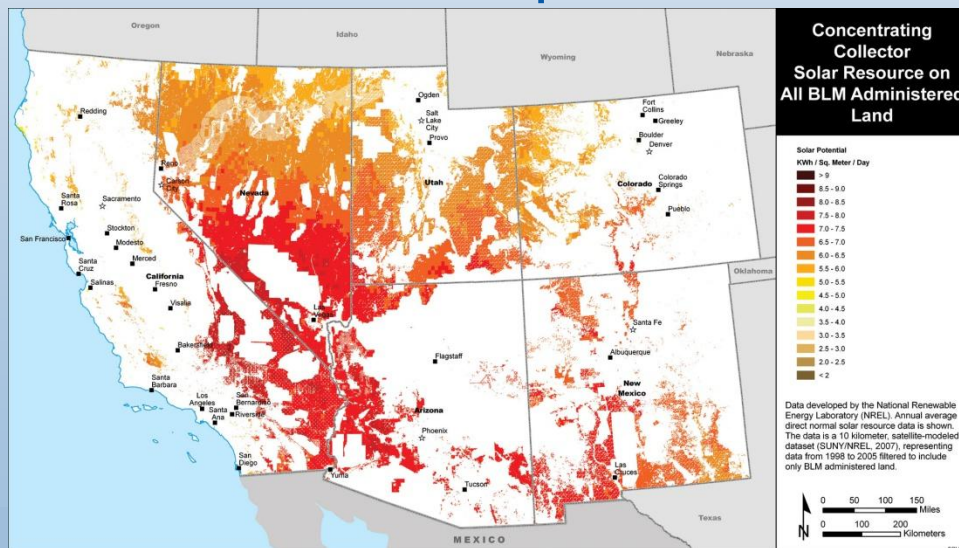

# CSP Deployment Issues

- Solar Resource
- Land
- Water
- Transmission Access/Interconnection
- Road Access
- Environmental requirements
- Financial Aspects

# CSP Deployment Issues

- Solar Resource
  - 6.0 kWh/m<sup>2</sup>-day or higher
    - Direct Normal Insolation
  - Increasing need for resource assessments
    - Install pyrometer & wind anemometer for 1 year data collection prior to financing

# CSP Deployment Issues

- Land
  - Trough/Power Towers
    - ~5 Acres per MW (without thermal storage)
    - ~7-8 Acres per MW (with thermal storage)
  - Dish-Stirling – 10 acres/MW
  - Slope
    - Ideally 1%, 3% feasible for parabolic trough or LFR
    - Slope up to 5% for Power Tower or Dish-Stirling

# CSP Deployment Issues

- Land
  - Site Preparation (Land disturbance variable)
    - Parabolic Trough, CLFR, and Power Tower requires cleared land to mitigate vegetation impacts on moving collector systems and heliostats
    - Dish-Stirling land disturbance minimized due to pole mounted systems (18" at base)
  - Minimal environmental impact of pyrometer/anemometer tower

# Solar & Wind Resource Monitoring

- 10 m tower
  - 4 guy wires at 5 m
- Measures:
  - Wind Speed
  - Wind Direction
  - Solar Resource
  - Temperature
- Wind monitored at 3 or 10 m

# CSP Deployment Issues

- Water
  - Wet Cooled Systems (Trough & Tower systems)
    - 800 gallons per MWh
      - Treatment for Demineralized Water
      - 10% for washing mirrors and boiler make-up
      - Water trucks with pressurized water between rows of receivers & heliostats

# CSP Deployment Issues

- Water
  - Dry Cooled Systems (Trough & Tower systems)
    - 80 Gallons per MWh
    - Treatment for Demineralized Water
      - Washing mirrors and boiler make-up
      - Water trucks with pressurized water between rows of receivers & heliostats
      - Evaporative Cooling Towers (make-up water)
    - Increase Electricity cost by 5-10%

# CSP Deployment Issues

- Water

## Air Cooled Tower

Fans are typically above the packing material where water cascades down from the steam-carrying tubes and draws outside air upward

# CSP Deployment Issues

- Water
  - Dish-Stirling Systems
    - No water cooling required
    - 4-5 gallons/MWh for mirror washing

# CSP Deployment Issues

- Transmission Access/Interconnection
  - Distance to Transmission major factor in site selection
  - Land Lease of right of entry critical for Interconnection Applications

# CSP Deployment Issues

- Road Access
  - Typical road access for any major construction project
  - Conventional sized vehicles for material delivery and construction equipment
  - On site access – paths between rows of collectors & heliostats

# CSP Deployment Issues

- Environmental requirements
  - Site Specific
    - T&E Species mitigation
    - Erosion control;
    - Restrict development in ACEC or other environmentally sensitive areas
    - Habitat disturbance mitigation

# CSP Deployment Issues

- Financial Aspects
  - Power Purchase Agreement
  - Land rights linked w/PPA to accessing financing
  - Land Lease Costs
  - On site construction/operations personnel
  - System dismantling and site remediation at end of PPA or useful life

# PV Technologies

- PV Technology Overview
  - Types of PV Modules
  - Flat Plate PV Systems
  - Concentrating PV
- Development Issues

# Photovoltaic Technology Overview

- Also called PV, solar panels, solar-electric and solar modules

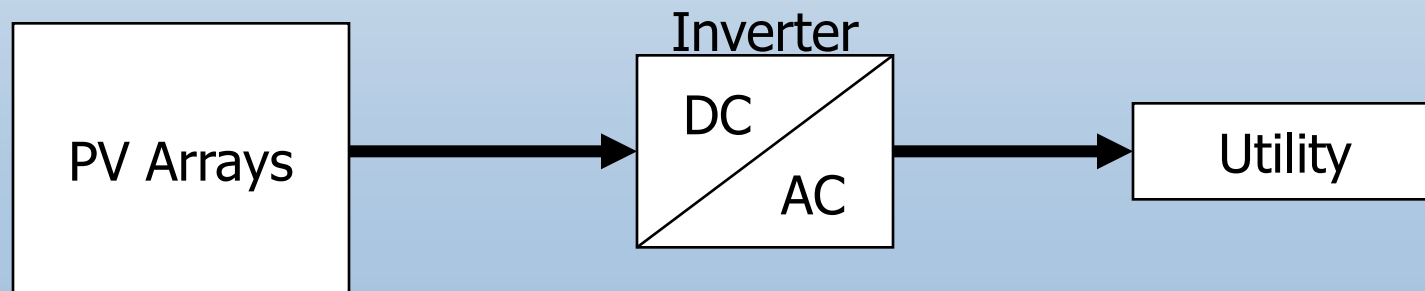

- If the sunlight is concentrated then it is called concentrator PV or CPV

# Photovoltaic Technology Overview

\*Includes storage, voltage regulation, inverters, etc.

# Photovoltaic Modules

- Flat plate types
  - Crystalline silicon
    - Single-crystal
    - Polycrystalline
  - Thin films
    - Amorphous silicon
    - Cadmium-tellurium
    - Copper-indium-diselenide

# Flat Plate PV Systems

Dangling Rope Marina, Glen Canyon National Recreation Area, UT

Arizona Public Service, Prescott, AZ

Alamosa PV System, Alamosa, CO

**5 – 10 acres per MW for PV systems**  
**Land can be left as is or graded**

# Concentrating PV Systems

Reflective

Refractive

Reflective + optical rod

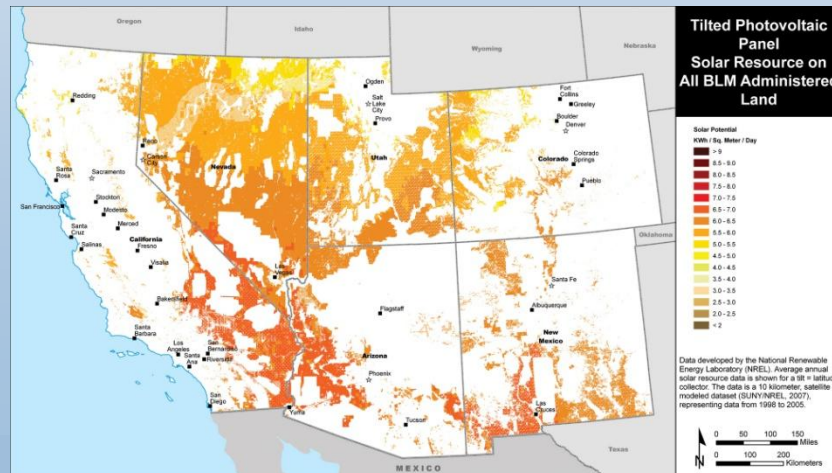

# PV Deployment Issues

- Solar Resource
- Land
- Water
- Transmission Access/Interconnection
- Road Access
- Environmental requirements
- Financial Aspects

# PV Deployment Issues

- Solar Resource
  - 6.0 kWh/m<sup>2</sup>-day or higher
    - Global Solar for Flat Plate PV
    - Direct Normal Insolation for Concentrating PV
  - Increasing solar resource assessments
    - Install pyrometer wind anemometer for 1 year data collection prior to financing

# PV Deployment Issues

- Land
  - 5 to 10 Acres per MW (average over 6)
    - Row spacing or array spacing varies for fixed flat plate and Concentrating PV
      - Mitigate shading
    - Increased spacing for single or dual axis tracking
  - Slope
    - Ideally 1%, 3% feasible for flat plate fixed
    - Higher slope up to 5% for pole mounted

# PV Deployment Issues

- Land
  - Site Preparation (Land disturbance variable)
    - PV can be mounted on monopoles to limit surface disturbance
    - Simple to grade for solar field
    - Systems include spacing between rows of panels/receivers for cleaning and maintenance
  - Minimal environmental impact of pyrometer/anemometer tower
  - Expect wind monitoring for tall PV systems

# Solar & Wind Resource Monitoring

- 10 m tower
  - 4 guy wires at 5 m
- Measures:
  - Wind Speed
  - Wind Direction
  - Solar Resource
  - Temperature
- Wind monitored at 3 or 10 m

# PV Deployment Issues

- Water
  - Limited water use (2-5 gallons per MWh)
    - Washing down panels and receivers
    - Some installations may not need cleaning
      - Cost trade off: production versus cleaning cost
    - Water trucks with pressurized water between rows of PV panels and Receivers

# PV Deployment Issues

- Transmission Access/Interconnection
  - Distance to Transmission major factor in site selection
  - Land Lease of right of entry critical for Interconnection Applications

# Deployment Issues

- Road Access
  - Typical road access for any major construction project
  - Conventional sized vehicles for material delivery and construction equipment
  - On site access – paths between rows of panels/receiverss

# PV Deployment Issues

- Environmental requirements
  - Site Specific
    - T&E Species mitigation
    - Erosion control;
    - Example: limit development in ACEC
    - Habitat disturbance

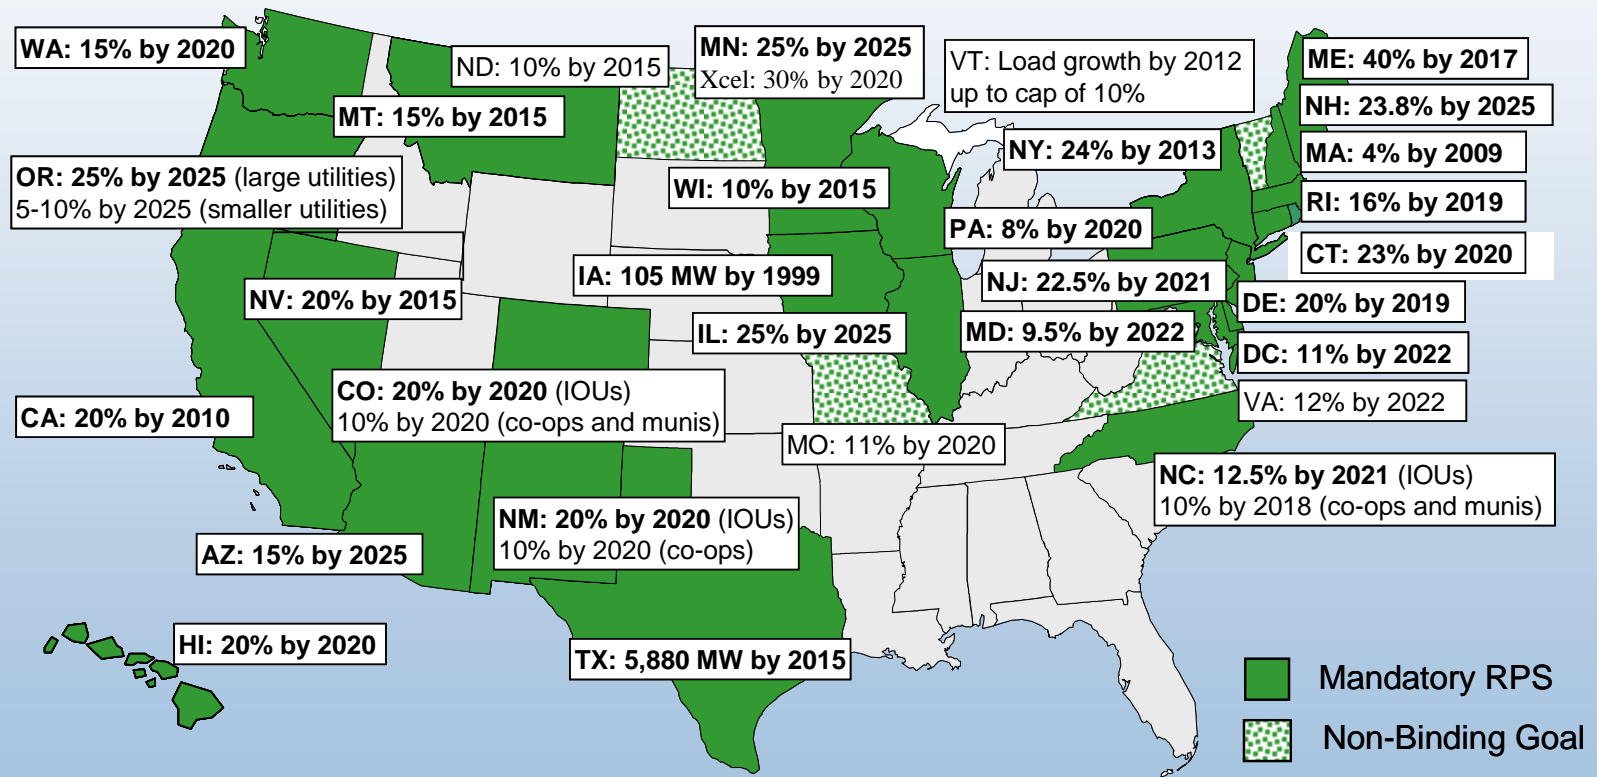

# PV Deployment Issues

- Financial Aspects
  - Power Purchase Agreement
  - Land rights linked w/PPA to accessing financing
  - Land Lease Costs
  - On site construction/operations personnel
  - System disposition at end of PPA or useful life

# Solar Market Factors

## State Renewable Portfolio Standards

# Solar Market Factors

- State RPS – Solar Set Aside
  - AZ, CA, CO, NV, NM
  - Typical 5-10% of new renewable generation must be from solar
- Renewable Energy Certificates
  - Value of Green Attributes (\$50-200/MWh)

# Solar Market Factors

- Federal Tax Incentives
  - 30% Solar Investment Tax Credit (ITC)
  - 5 year accelerated depreciation
- State Tax Credits
  - NM Production Tax Credit
    - ~\$.02/kWh for 10 years
- State Property or Sales Tax Exemptions

# Solar Market Factors

- State PUC System Benefit Funds
  - Financial Incentives for Renewable Energy generation
- Municipal Utility Financial Incentives
  - Example: LADWP
- Current Renewable Incentives are available at: <http://www.dsireusa.org/>

# BLM HQ Lands & Realty Support

- Funds provide to NREL for:
  - BLM Field Office Solar Training
  - Review of ROW Application PODs and related consultation
  - BLM FOs request NREL support through Rick Stamm, who directs NREL tasks
    - 202-452-5185
    - Rick\_Stamm@blm.gov

# Summary

- CSP and PV technologies offer a wide range of options to utility-scale markets.
- The solar resource in the Southwest is immense.
- Utility Scale CSP and PV plants to be primarily to be installed in the Southwest.
- Provide significant domestic electrical energy supply
